

Abstract (in conjunction with fig. 1)

For the dispatch-ready packing of, in particular, cigarette packs or cigarette bundle packs (12), a device is provided, in which the box packer (14) and the palleting station (29) are combined, in order to introduce the bundle packs (12) into boxes (10) and to deposit the latter on pallets (11). The structurally combined units form an overall device which can be operated jointly.
